

# Nodebots - Electronics Primer

---

*#nodebotsau #nbd14*

$$V = I * R$$

VOLTAGE?  
CURRENT?  
RESISTANCE?  
OHM'S LAW?

BEFORE WE PLUG IN THE ARDUINO,  
WE WILL REVIEW A FEW TERMS  
AND PRINCIPLES THAT HAVE TO  
DO WITH HOW ELECTRICITY (AND  
THEREFORE ELECTRONICS) WORKS.

**VOLTAGE (V)**  
IS A MEASURE  
OF ELECTRICAL  
POTENTIAL.  
IT IS MEASURED  
IN **VOLTS**.

**CURRENT (I)**  
IS THE AMOUNT  
OF FLOW  
THROUGH A  
CONDUCTIVE  
MATERIAL.  
IT IS MEASURED  
IN **AMPERES**  
OR **AMPS**.

**RESISTANCE (R)**  
IS A MATERIAL'S  
OPPOSITION TO  
THE FLOW OF  
ELECTRIC  
CURRENT.  
IT IS MEASURED  
IN **OHMS**.

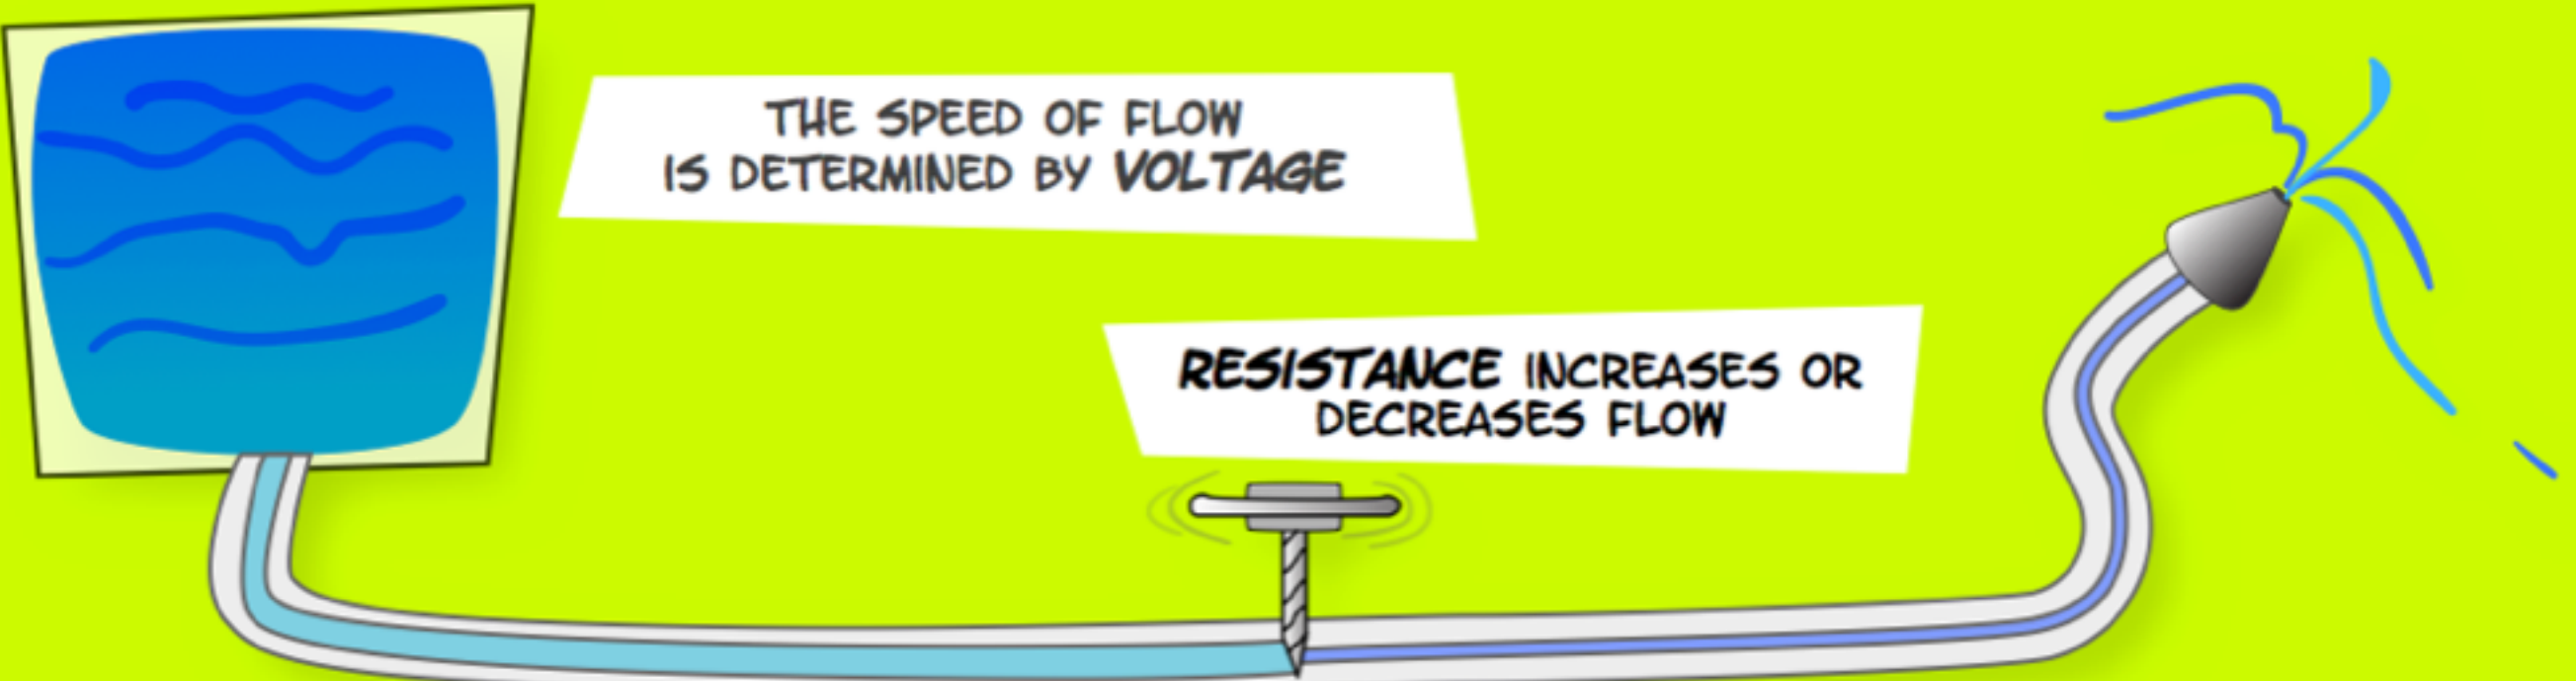

ELECTRICITY IS THE FLOW OF ENERGY THROUGH A CONDUCTIVE MATERIAL.

THE SPEED OF FLOW  
IS DETERMINED BY **VOLTAGE**

**RESISTANCE** INCREASES OR  
DECREASES FLOW

AMOUNT OF FLOW MOVING THROUGH  
PIPES IS **CURRENT**

THE WATER ANALOGY IS COMMONLY USED TO EXPLAIN THESE TERMS. HERE'S ONE MODEL.

# Resistors are like a sand filters

---

# Resistors in series

---

# Resistors in parallel

---

# Diodes and LEDs

---

$$V = I * R$$

**Physical computing** is building interactive systems, using hardware and software, to sense and respond to the physical world.

Our nodebots will have sensors and actuators, and they will use a microcontroller for decision making...

---

AN ARDUINO CONTAINS A **MICROCHIP**, WHICH IS A VERY SMALL COMPUTER THAT YOU CAN PROGRAM. YOU CAN ATTACH SENSORS TO IT THAT CAN MEASURE CONDITIONS (LIKE HOW MUCH LIGHT THERE IS IN THE ROOM). IT CAN CONTROL HOW OTHER OBJECTS REACT TO THOSE CONDITIONS (ROOM GETS DARK, LED TURNS ON).

MICROCONTROLLERS USE **INPUTS** AND **OUTPUTS** LIKE ANY COMPUTER. INPUTS CAPTURE INFORMATION FROM THE USER OR THE ENVIRONMENT WHILE OUTPUTS DO SOMETHING WITH THE INFORMATION THAT HAS BEEN CAPTURED.

# Types of sensors

---

- **Acoustic, sound, vibration:** microphone, lace sensor (guitar pickup)
- **Chemical:** CO<sub>2</sub>, CO, pH, smoke detector, breathalyser
- **Electric current, electric potential, magnetic, radio:** magnetometer, hall-effect sensor, electron multipliers
- **Environment, weather, moisture, humidity:** soil moisture, water sensor
- **Flow, fluid velocity:** flow meter
- **Ionizing radiation, subatomic particles:** geiger counter, particle detector
- **Position, angle, displacement, distance, speed, acceleration:** capacitive sensing, gyroscope, accelerometer, LIDAR, tachometer, tilt
- **Optical, light, imaging, photon:** infra-red, LED as light sensor, photo-resistor, camera
- **Pressure:** barometer, tactile sensor, piezometer
- **Thermal, heat, temperature:** thermistor
- **Proximity, presence:** ultra-sonic sensor

# Examples of sensors and input devices

---

- **Ultrasonic sensor:** used to detect distance from objects.
- **Photo resistor:** used to detect light.
- **Push button:** used to capture discrete input or collision
- **Camera:** used to capture visual information

# Types and examples of actuators

---

- **Light and display:** LED, LCD
- **Sound:** piezo buzzer

- **Motion and switching:** DC motor, servo motor, solenoid relay

- Others, such as: hydraulic, pneumatic, mechanical

# Digital vs Analog signals

---

**Digital components rely on discrete values, typically indicated by high and low voltages**

- 5V (or 3.3V) => high => 1 => ON
- 0V => low => 0 => OFF
  - Examples of digital sensors: tilt sensor, push button
  - Examples of digital actuators: relay, LCD display, servo motor

**Analog components use continuous values, produced as a signal over time**

- Values are usually constrained, e.g. 0-100mA or 0-100k
  - Examples of analog sensors: accelerometer, thermistor, photo-resistor
  - Examples of analog actuators: DC motor

Note: Some sensors support both Analog and Digital outputs.

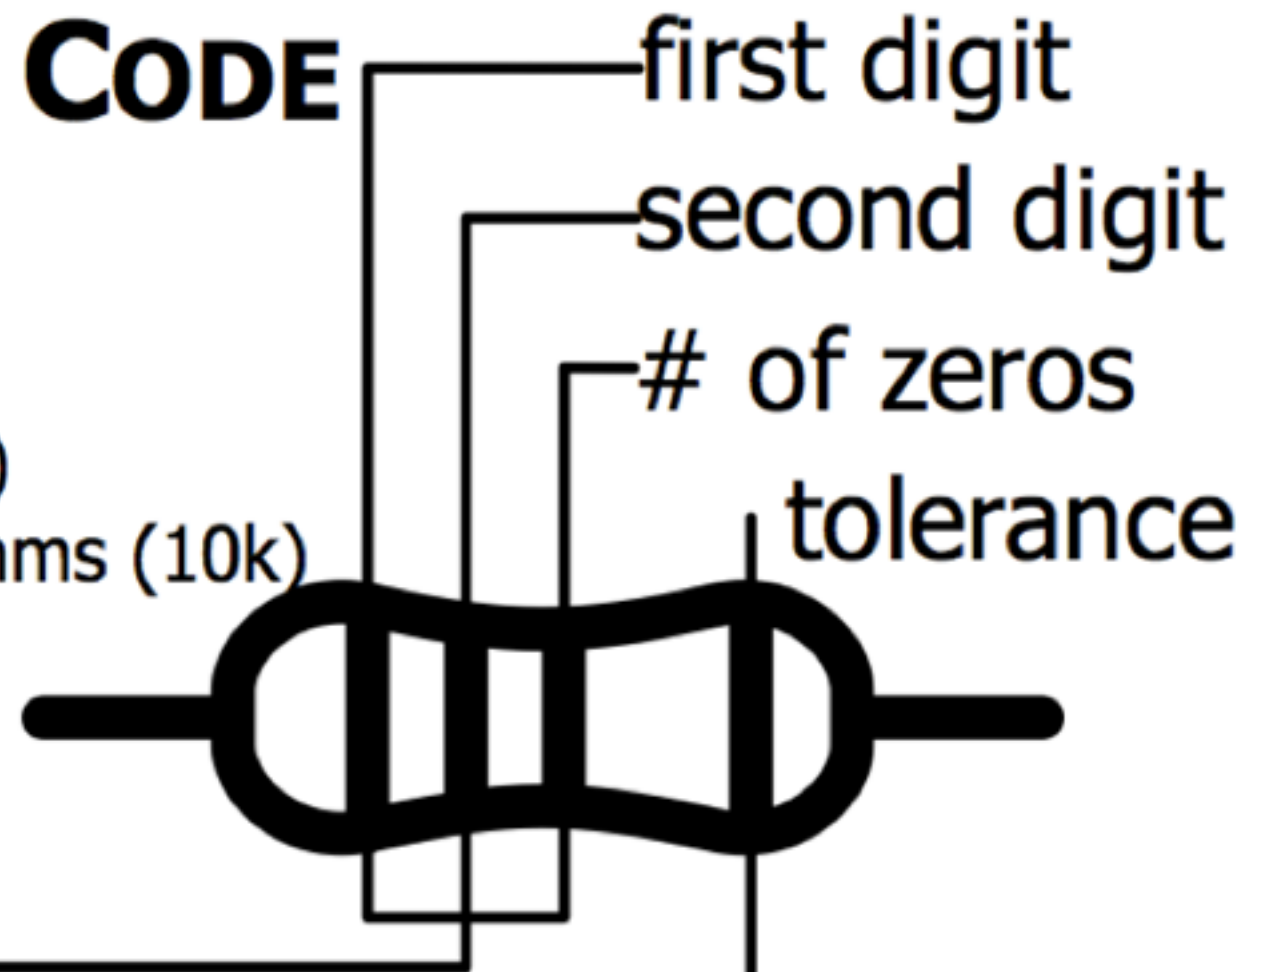

# RESISTOR COLOR CODE

## Examples:

green-blue-brown - 560 ohms

red-red-red - 2 200 ohms (2.2k)

brown-black-orange - 10 000 ohms (10k)

0 - Black

1 - Brown

2 - Red

3 - Orange

4 - Yellow

5 - Green

6 - Blue

7 - Purple

8 - Grey

9 - White

20% - none

10% - silver

5% - gold

# Breadboard

Good luck!
